

AgriMarket

Agricultural data
at your fingertips

The problem

In agriculture adoption of dataspace is still in early stages

Sharing data between different actors is difficult when metadata is poorly described

Our solution

Intuitive and modern
designing

AI-driven data-analysis

Metadata creation
according to Dublin Core
and DCAT standards

4 step masterplan

of AI 🧙

Remember to thank the AI
before it's too late 🤖

1. Unzip

Traverse the directory

Directory Structure:

```
└─ Challenge C
    └─ Challenge C links.txt
        └─ 3_OpenDroneMap
            └─ odm_texturing
                ├── odm_textured_model_geo_material0002_map_Kd.png
                ├── odm_textured_model_geo_material0005_map_Kd.png
                ├── odm_textured_model_geo_material0008_map_Kd.png
                ├── odm_textured_model_geo_material0000_map_Kd.png
                ├── odm_textured_model_geo.conf
                ├── odm_textured_model_geo.mtl
                ├── odm_textured_model.mtl
                ├── odm_textured_model_geo.glb
                ├── odm_textured_model_geo_material0009_map_Kd.png
                ├── odm_textured_model_geo_material0011_map_Kd.png
                ├── odm_textured_model_geo_material0013_map_Kd.png
                ├── odm_textured_model_geo_material0006_map_Kd.png
                ├── odm_textured_model_geo_material0012_map_Kd.png
                ├── odm_textured_model_geo_material0010_map_Kd.png
                ├── odm_textured_model_geo.obj
                ├── odm_textured_model_geo_material0007_map_Kd.png
                ├── odm_textured_model_geo_material0001_map_Kd.png
                ├── odm_textured_model_geo_material0008_map_Kd.png.aux.xml
                ├── odm_textured_model_geo_material0004_map_Kd.png
                ├── odm_textured_model_geo_material0014_map_Kd.png
                └── odm_textured_model_geo_material0003_map_Kd.png
            └─ odm_report
                ├── stats.json
                ├── report.pdf
                └── shots.geojson
        └─ cameras.json
```

2. Key files

Identify the files with
key information

```
Files of Interest: [  
  {  
    file: "Challenge C/Challenge C links.txt",  
    reason: "This text file may contain links that point to relevant information",  
  },  
  {  
    file: "Challenge C/3_OpenDroneMap/cameras.json",  
    reason: "As a JSON file, it likely contains structured data about the cameras used in the challenge",  
  },  
  {  
    file: "Challenge C/3_OpenDroneMap/odm_report/stats.json",  
    reason: "This JSON file probably contains statistical information about the challenge",  
  },  
  {  
    file: "Challenge C/3_OpenDroneMap/odm_georeferencing/odm_georeferencing.tif",  
    reason: "This file likely contains valuable metadata about the challenge",  
  },  
  {  
    file: "Challenge C/3_OpenDroneMap/odm_orthophoto/odm_orthophoto.tif",  
    reason: "The TIF file is an image file that may hold significant information about the challenge",  
  }  
]
```

3. Summarize

Summarize information
from the key files and
file names

Summary: The excerpts from the provided files indicate an initiative focused on agricultural data, specifically under the framework of an Agricultural Data Marketplace (Challenge C). Key components include links to valuable resources such as the AGROVOC vocabulary, a multilingual thesaurus that enhances data discoverability in agricultural domains, accessible through the FAO link.

One major aspect of the challenge involves the application of drones and OpenDroneMap (ODM) technology for agricultural data collection and analysis. The cameras used in this context are detailed in JSON format, specifying parameters that adhere to precision requirements vital for applications in crop monitoring and precision agriculture. Drones capture aerial imagery to process various statistics, including feature extraction and reconstruction metrics, which are crucial for creating detailed maps that support agricultural management practices.

Another key data point is the camera data ...

4. Standardize

Take all the previous information and ask GPT to fill the fields

```
export const dublinCoreSchema = z.object({
  title: z.string().describe("A name given to the resource."),
  creator: z.string().optional().describe("An entity primarily responsible for making the resource."),
  subject: z.string().optional().describe("The topic of the resource."),
  description: z.string().optional().describe("An account of the resource."),
  publisher: z.string().optional().describe("An entity responsible for making the resource available."),
  contributor: z.string().optional().describe("An entity responsible for making contributions to the resource."),
  date: z.string().optional().describe("A point or period of time associated with an event in the lifecycle of the resource."),
  type: z.string().optional().describe("The nature or genre of the resource."),
  format: z.string().optional().describe("The file format, physical medium, or dimensions of the resource."),
  identifier: z.string().optional().describe("An unambiguous reference to the resource within a given context."),
  source: z.string().optional().describe("A related resource from which the described resource is derived."),
  language: z.string().optional().describe("A language of the resource."),
  relation: z.string().optional().describe("A related resource."),
  coverage: z.string().optional().describe("The spatial or temporal topic of the resource, spatial applicability, or jurisdiction."),
  rights: z.string().optional().describe("Information about rights held in and over the resource."),
});

export type DublinCoreMetadata = z.infer<typeof dublinCoreSchema>;
```

```
const completion =
  await openai.beta.chat.completions.parse(
    {
      model: "gpt-4o-mini",
      messages: [
        {
          role: "user",
          content: prompt,
        },
      ],
      response_format:
        zodResponseFormat(
          dublinCoreSchema,
          "dcmi_metadata"
        ),
    }
  );
```

```
Generated DCMI Metadata: {
  title: "Agricultural Data Marketplace Challenge C",
  creator: "Not Available",
  subject: "Drone Technology, Agricultural Data, Remote",
  description: "This dataset encompasses drone-collected",
  publisher: "Not Available",
  contributor: "Not Available",

}
```

Prompts

```
const prompt = `
You are an AI assistant tasked with analyzing
the following directory structure to identify
files that are likely to contain valuable information
for metadata generation in their first 1000 bytes of ascii.
Consider factors such as file types, names, and typical content
relevance. Please list the files of interest along with a brief
explanation for each selection. List maximum 5 files and make
sure the file paths are correct and work.

Directory Structure:
${directoryStructure}
`;
```

```
const summarizationPrompt = `
Based on the following file excerpts, please summarize
the key information, highlighting agriculture-related data.
Use AGROVOC terms where appropriate. The summary should be in free-form text.

File Excerpts:
${fileExcerptsText}
`;
```

```
const mainPrompt = `
Directory Structure:
${dirStructure}

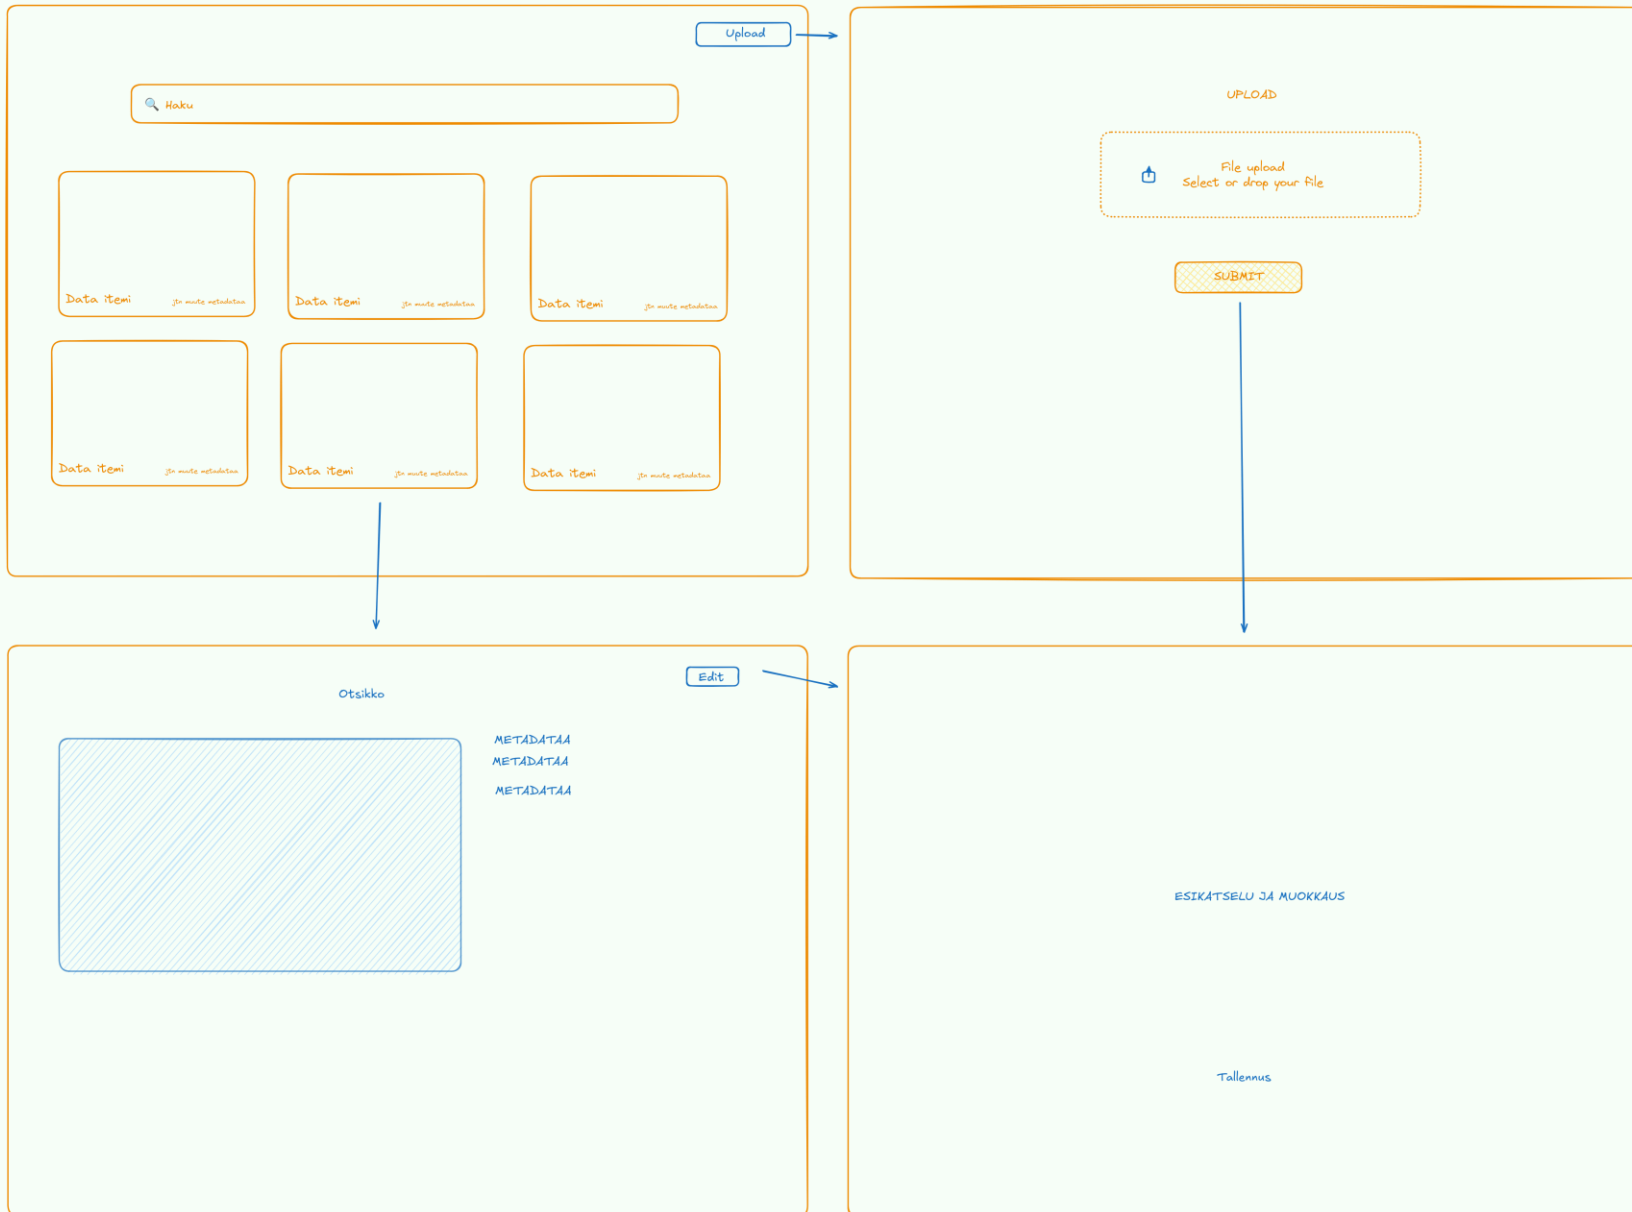

All file extensions:
${extensions.join(", ")}

Summary:
${summaryOrFilesKeyInfo}

Using this information, generate
Dublin Core Metadata Initiative (DCMI)
metadata for this dataset. Ensure that
each metadata element accurately reflects
the content and context of the files. Use
MIME types for the dc:format If certain metadata
elements cannot be determined from the provided
information, please indicate them as "Not Available."

dc:identifier: ${id}
